

Protect Your Newborn Against Serious Illness

Get the RSV Vaccine

RSV, or respiratory syncytial virus, is a very common virus that spreads in the fall and winter and can be dangerous for babies and young children. Getting the RSV vaccine during pregnancy is one way you can protect your child from severe RSV illness during their first cold and flu season.

The vaccine is given once between your 32nd and 36th week of pregnancy, allowing your body to develop antibodies that are passed along to your baby before birth to help protect them from getting very sick from RSV.

WE RECOMMEND PREGNANT PEOPLE GET THE RSV VACCINE

Please talk to your doctor today about getting the RSV vaccine during pregnancy and protecting your baby from RSV illness.

If you are unable to get the RSV vaccine during pregnancy, your baby can receive nirsevimab, an RSV antibody product, which can help protect them during their first cold season.
